Maryland Historical Trust

Maryland Inventory of Historic Properties Number: AL-V-B-303

Name: Jennings Run Br. (1003)

The bridge referenced herein was inventoried by the Maryland State Highway Administration as part of the Historic Bridge Inventory, and SHA provided the Trust with eligibility determinations in February 2001. The Trust accepted the Historic Bridge Inventory on April 3, 2001. The bridged received the following determination of eligibly.

Other Type Name ___

DESCRIPTION

Describe the Setting:

Situated in Maryland's Appalachian Plateau physiographic province, Bridge 1003 carries MD 831C over Jennings Run in northern Allegany County. MD 831C runs in a generally east-west direction while Jennings Run, a tributary of Willis Creek, flows primarily northward. Bridge 1003 spans Jennings Run on the east side of the village of Corriganville a short distance downstream of Bridge 1004 which carries MD 36 over Jennings Run. MD 831C intersects with MD 36 southeast of the two bridges. Several late-nineteenth and early-twentieth century buildings stand adjacent to Bridge 1003's west abutment and wing walls.

**Describe the Superstructure and Substructure:
(Discuss points identified in Context Addendum, Section C)**

Bridge 1003 consists of two 31-foot, concrete beam spans constructed by the State Roads Commission in 1930 according to a plaque affixed to its north abutment. The bridge provides a 24-foot clear roadway for two lanes of traffic across its 70 feet total length. A four-foot wide sidewalk extends along the downstream side of the structure. Concrete balustrades enframe both sides of the bridge. Bituminous asphalt covers the original concrete road bed. A w-beam traffic barrier protects the southeast approach. Concrete and stone compose the west abutment while the northwest wing wall, the east abutment and wing walls and the central pier utilize concrete construction. The southwest wing wall and retaining wall is made of stone. The use of stone in the west abutment indicates that the State Roads Commission probably reused the location of an earlier bridge.

A survey of historic concrete beam bridges undertaken by the Maryland State Highway Administration in the Fall of 1995 identified 113 bridges of that type located throughout the state. Nearly one-quarter (26) of that total were double-span bridges; 38 bridges (34%) were multiple span.

Much of the super- and substructure components display spalling, cracking and scaling. One of the concrete beams possesses excessive cracking and spalling that has exposed reinforcing bars. An underwater inspection report from July 1994 noted scour, medium scale, and a vertical hairline crack on the breastwall of the west abutment. Inspection reports from May and September 1988 indicated that the bridge displayed general deterioration of the concrete girders at the piers and abutments, as well as large spalled areas, open and irregular cracks, efflorescence, delamination, hollow-sounding areas, and exposed rusted rebars on the abutments, wing walls, piers, and girders.

Discuss major alterations:

Inspection reports note that in September 1988 repairs were made to the west abutment breastwall, pier cap, and gunite was used to repair the concrete over exposed rebars.

HISTORY

When Built: 1930

Why Built: Unknown

Who Built: State Roads Commission

Who Designed: Unknown

Why Altered: Does not apply

Was this bridge built as part of an organized bridge building campaign?: No, historic documents do not indicate that this bridge was erected as part of an organized building campaign.

SURVEYOR ANALYSIS

This bridge may have NR significance for association with:

A (Events) B (Person) C (Engineering/Architectural Character)

Was this bridge constructed in response to significant events in Maryland or local history?

Research has not identified any significant events or trends in Maryland or local history that contributed to Bridge 1003's construction.

When the bridge was built, and/or given a major alteration, did it have a significant impact on the growth and development of the area?

Construction of Bridge 1003 had a negligible impact on the surrounding area's development and growth.

Is the bridge located in an area which may be eligible for historic designation, and would the bridge add or detract from the historic and visual character of the possible district?

Research at the Maryland Historical Trust indicates that Bridge 1003 is encompassed within the Maryland Coal Heritage Survey, which included all of Garrett County and the western portion of Allegany County. A book discussing the survey (Ware 1991) included a section on concrete bridges within the survey area, however, Bridge 1003 was not singled out as a representative example of this type of structure.

Is the bridge a significant example of its type?

No, this bridge is not a significant example of its type. Although most of its character defining elements survive with good integrity, the structure is a commonplace example of a standard bridge type.

Does the bridge retain integrity of the important elements described in the Context Addendum?

Despite evidence of spalling, cracking and scaling of many super- and substructure elements, Bridge 1003 appears to retain good integrity of its character defining elements. Inspection records do not indicate that any prior insensitive repairs or major alterations have occurred to the bridge.

Is the bridge a significant example of the work of the manufacturer, designer, and/or engineer, and why?

Although probably a variant of the State Roads Commission's 1930 standard plan for concrete girder bridges, Bridge 1003 is neither a significant example of that type nor of the Commission's bridge construction efforts in general.

Should this bridge be given further study before significance analysis is made, and why?

No. Further study is unlikely to reveal any additional information linking Bridge 1003 with any significant patterns, events or persons, or associations with significant engineering and/or methods of construction.
