

HO 738, Bonnie Branch Mill,
ca. 1860.
Ellicott City vicinity, Ilchester area, public access.
Capsule Summary, page 1.

Description:

Two structures comprise the Bonnie Branch Mill site; these are the concrete foundation remains of the mill building and the intact stone dam crossing Bonnie Branch above the mill ruins. The mill foundation rises from a terrace cut into the hillside above the south bank of Bonnie Branch, now channeled in this location. Four battered concrete piers of varying dimensions form the foundation, and appear to have been configured to accommodate shafting and gears suspended from the now vanished wooden or metal superstructure above. Evidence of erosion also suggests that waste water from the wheels above drained beside the piers and washed over the terrace to the branch. Between the mill and the dam is a depression leading to a pipe which protrudes from the base of the dam. Perhaps here is evidence of a closed system, conveying water under pressure to the mill wheels or turbines, a sophisticated system to generate substantial power on a relatively constricted site. The dam itself is constructed of stepped back courses of rough-faced ashlar blocks.

HO 738, Bonnie Branch Mill,
ca. 1860.
Ellicott City vicinity, Ilchester area, public access.
Capsule Summary, page 2.

Significance:

The Bonnie Branch Mill was constructed on land owned by George Ellicott, Jr., and was evidently intended to augment Ellicott's flour milling operations already underway at the nearby Ilchester Mill. Financial losses resulting in part from the panic of 1837 had driven the Ellicott family out of their industrial operations in Ellicott City, and by establishing his residence and mills down river, in Ilchester, Ellicott apparently hoped to keep alive the family name in the merchant flour milling business, and to promote the growth of Ilchester--as his grandparents' generation had done with Ellicott City. Little documentary evidence survives about his mill on Bonnie Branch. An 1851 deed suggests that milling operations on the branch were at least under consideration, though the evidence of maps indicates that no mill was functioning here until ca. 1860. In addition, the facility did not appear in a detailed 1878 atlas, leaving a rather short-lived existence. Ellicott divested himself of the Ilchester properties in 1866, and the two surviving deeds make no reference to the Bonnie Branch Mill. Was it by then destroyed?

Contributing Resource Count: 2

The two structures comprised in this site are the foundation remains of the Bonnie Branch Mill and the intact stone dam crossing Bonnie Branch above the mill site.

A large rectangular terrace, approximately 50 feet by 200 feet, partially built up and partially cut into the hillside above the south bank of Bonnie Branch, supported the mill foundation. The north wall of the terrace, occupying the long side of the rectangle, faces the branch and is formed of poured concrete, as are the four large battered piers above, which supported the mill structure. Marks of plank shuttering remain on the piers only; the terrace wall surface has eroded over time. Each pier rises to a maximum height of eight feet, and the overall dimensions for each one are as follows, from east to west: pier A is 16.5 by 13.5 feet; pier B is 16 by 13.5 feet; pier C is 23 by 39 feet; and pier D, a mirror image of C, is also 23 by 39 feet. Piers C and D have ell-shaped footprints, and comprise complex arrangements of raised and lowered foundation surfaces, evidently so varied to accommodate shafts and gearing. Iron bolts set into the concrete rise from the tops of most of these piers and surfaces, clearly intended to secure the wooden beams or iron girders of the mill's superstructure. Gaps at the level of the terrace between each of the piers suggest that the falling water required to drive the machinery ultimately flowed between the piers, across the terrace to the north, and cascaded over the retaining wall to reach Bonnie Branch. The eroded condition of the terrace wall is consistent with such a configuration. Running northwest from the mill foundation toward the dam is a slight depression in the ground, perhaps suggesting the course of a mill race, though a large iron pipe protrudes from the lower reaches of the dam. This pipe may have connected to a closed system no longer extant, which conveyed water to the factory under gravity pressure--insuring greater motive force than that provided by an open canal. In this case the depression may mark the path of the conduit.

The dam itself, some 200 feet from the western end of the terrace, spans approximately 75 feet over a fall of 25 feet, and is constructed of rough-faced ashlar blocks laid in horizontal courses of two stones in height but for the uppermost, which is of three. Each paired course steps back above its neighbor, giving the dam a profile of six set-back steps.

Prepare both a summary paragraph of significance and a general statement of history and support.

Bonnie Branch Mill

The Bonnie Branch Mill was the third of at least three merchant mills erected in the Ilchester area in the early- to mid-nineteenth century, and represents an attempt to establish Ilchester as a diversified milling community with the potential for rapid growth, much like Ellicott City had been in the eighteenth century. The first nineteenth-century construction in Ilchester was the Thistle Cotton Mill, of 1824, (Inventory Number BA 144, Baltimore County), and the second was the Ilchester Flour Mill, of 1833, (Inventory Number HO 737, Howard County). A precise construction date for the Bonnie Branch Mill is unknown, however the evidence presented on a series of regional maps suggests that the installation became operational between 1857 and 1860. In 1878, the mill was not shown in a detailed atlas of Howard County, indicating a rather short-lived existence. Nevertheless, the mill ruins stand also as an example of the Ellicott Family's continued attempts to maintain a regional presence in the merchant milling of flour, an industry they initiated on the Patapsco in 1771. The family lost the facilities at Ellicotts Mills in 1841, leaving George Ellicott, Jr. (1798-1869), alone, to operate the facilities at the Ilchester Mill, and later, evidently, at the Bonnie Branch Mill.

Little information survives about the extensive ruins and dam of the Bonnie Branch Mill. George Ellicott, Jr. (1798-1869) acquired this and other tracts from the estate of his father, George Ellicott, Sr. (1760-1832), and from others in the Ellicott family in 1834, 1838, and 1839 (Baltimore 235/39, Anne Arundel 22/627, and Howard 1/291). The purchases amounted to some 130 acres, and on the first of these tracts Ellicott began construction of the Ilchester Flour Mill in 1833, before the deed of sale had been officially recorded (see inventory form

Section 8.1

HO 737). In 1851, Ellicott sold the mill pool and dam for the Ilchester Mill to his nephew James Tyson, so that Tyson might make improvements to the dam to increase the water power available to the mill. The provisions agreed upon record Ellicott's attempt to protect the full water fall--or water power--of Bonnie Branch, which would enter the Patapsco above the improved dam Tyson was to construct. Ellicott reserved the right to cut "a channel in the valley of Bonnie Branch across the above described land [sold to Tyson] to Patapsco Falls to discharge the water that [Ellicott] . . . may employ in the driving of any Mill or Mills that the said Ellicott or his heirs and assigns may erect on bonnie branch" (Howard 10/396).

Further public record research may produce a clear chain of title for the property, and may indicate exactly when the Bonnie Branch Mill was constructed; the 1851 deed indicates at least that at that date such a structure had not yet been built. Taylor's Map of the City and County of Baltimore labels the site "Flour Mill" (singular) in 1857. By 1860, Martenet's Map of Howard County shows structures on the north and south side of Bonnie Branch and at the Patapsco which it labels generally "G. Ellicott's Flour Mills" (plural), while Raynolds' Military Map of 1863, shows only structures north of the branch, labeled "G Ellicotts M[ill]s." The Schofield lithograph of the Patapsco Valley, dated to the early 1860s, however, shows Bonnie Branch Road with no structures, and G. M. Hopkins' 1878 Atlas of Howard County similarly shows no structures on the site below the branch. Allowing for artistic license, inaccuracies in maps, and changes in road and river beds (Bonnie Branch today is channeled in this location), it is possible George Ellicott erected an additional mill or mills adjacent the branch, but Martenet's Map is the only one of these sources to show structures on the site south of the road and branch, on the site of the extant foundation. George Ellicott sold land north and south of Bonnie Branch in the summer of 1866, and the deeds make no reference to mill structures; the metes and bounds of the parcel he sold south of the branch are unknown, however, and may not have included the mill site (Howard 25/404, and 26/181).
